S.O.D

*Reasons for allowance*

The following is an examiner's statement of reasons for allowance:

While Adelhelm et al. (SPIE, 1996, vol. 2629, pages 325-332) disclose a method of detecting the immobilization of nucleic acid on a solid surface involving a probe beam and a pump beam, the artisans employ a light absorbing chromophoric group (page 326, top paragraph), particularly, ethidium bromide or acridine orange (page 328, bottom paragraph) bonded to the immobilized nucleic acid (page 328). The pump beam is designed emit a wavelength which is maximally absorbed by the intercalating agents, in the range of 480 to 520 nm (page 328, bottom paragraph). The absorption of the light from the pump beam produces "thermal waves" and the direction of the probe beam is altered in view of the produced thermal waves, the alteration allowing the detection of the immobilized nucleic acids (pages 329-330; Figures 9 and 12).

The instant claims differ from the prior art in that the immobilized nucleic acid or the nitrogenous base is "not marked with a dye." In addition, the claims involve the probe beam which produces a wavelength which is outside of the wavelength of the pump beam employed by Adelhelm et al. Hence, there is no expectation of success that the nucleic acid without a dye would produce a "thermal wave," which alters the direction of the probe beam, thus at best it would have only been "obvious to try," which is not the standard for forming a *prima facie* case of obviousness.
